

CPS National conducted a comprehensive review and testing program on a number of critical network sites for a major Australian telecommunications company

OVERVIEW

CPS National were recently contracted to undertake preventative work on a number of sites for an Australian telecommunications provider.

Following a failure on a critical interstate site, the customer contracted CPS National to conduct a detailed review and testing program on over 40 NSW based sites to identify and rectify any issues that could cause an incident similar to that experienced at the interstate site.

Tasked with servicing a large volume of sites, some of which were located a significant distance from the Sydney metro area, the CPS National team acted quickly to ensure all sites were serviced within the customers expected short turn-around period.

The team conducted a visual inspection of all network infrastructure, tested the backup battery systems and provided detailed reports documenting all defects, test results, photos and recommendations for each site.

CPS National completed the requirements ahead of the customers expected schedule, identifying and rectifying a number of issues that may have provided a significant threat to the networks integrity.

CPS National completed preventative testing and rectification work across numerous NSW sites

PROJECT OVERVIEW

Client: Major Telecommunications Company

Location: NSW

PROJECT SCOPE

Preventative work undertaken on a number of critical network sites.

UNIQUE FEATURES

The broad network area, short turn-around times and ad-hoc nature of repair works provided a unique challenge for the CPS National team.

OUTCOME

- The CPS National team completed the works ahead of schedule, with a number of reliability issues identified and rectified for the customer.
